Annual temperature and recommended clothing

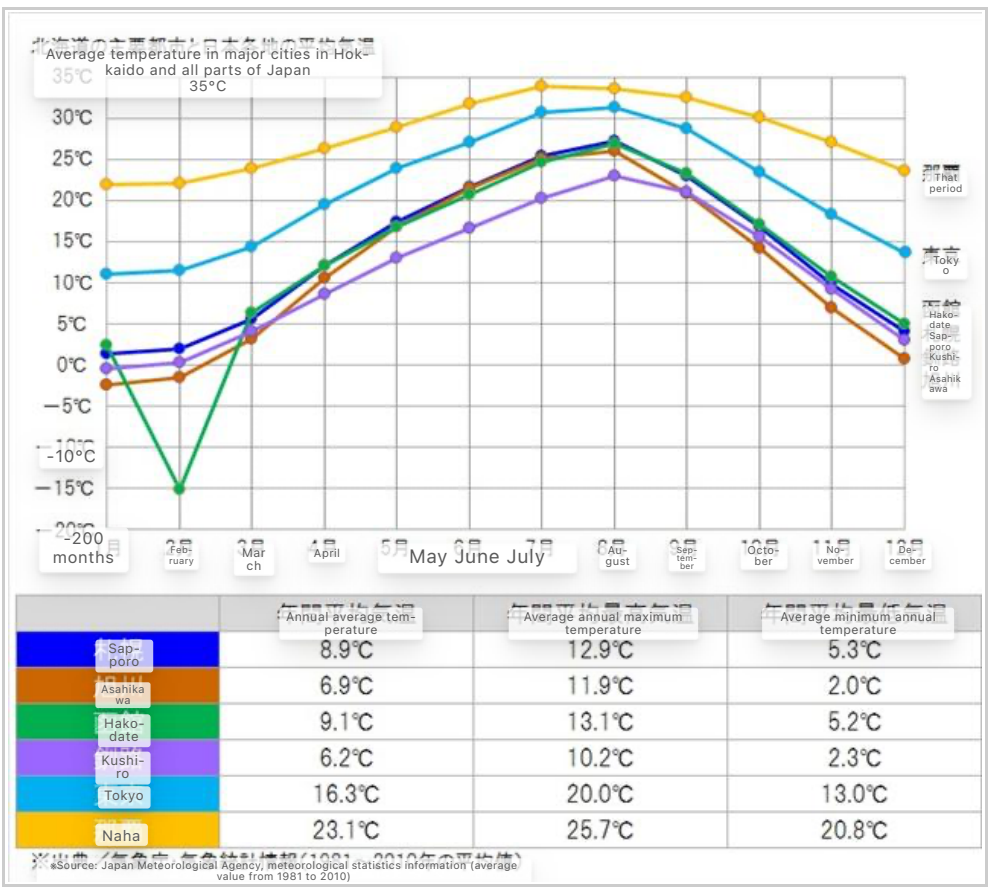

Average annual temperature in Hokkaido and trends in various regions

Except for parts of southern Hokkaido, almost the entire Hokkaido region has a sub-agarn climate, and the temperature is low throughout the year. Even in summer, there are only a few days when it exceeds 30°C, and there are few tropical nights above 25°C. It's safe to have one to wear for the morning and evening when it's cold even in summer.
In the middle of winter, there are many days below freezing even during the day, and the lowest temperature is around 20 degrees below zero. In the Okhotsk region, blizzards can rarely blow. During the severe winter period from December to February, please prepare winter clothes that keep the ends of the body warm, and non-slip shoes to avoid injuries caused by falls.
It varies by region, but Sapporo's annual rainfall is about 1100 millimeters, and the snowfall is more than 600 centimeters. The temperature difference varies greatly depending on the season, and the four seasons are clear, so if you know the characteristics of the climate and prepare, you can travel to Hokkaido more comfortably.
