## The state of snow

The image of Hokkaido is snow. It is true that it starts to snow in October every year, and the root snow does not melt until April. In other words, it is calculated that half a year will be winter. In winter, dry winds (seasonal winds) blow from the continent towards Japan. When this wind passes through the Sea of Japan, it absorbs a lot of water vapor and grows into clouds with plenty of moisture. This cloud will bring heavy snow to the Sea of Japan side and the Okhotsk region. However, in the central part of Hokkaido, there are a series of high peaks such as Mt. Daisetsu, and after crossing the peaks, it becomes dry air and passes into the Pacific Ocean, so the amount of snowfall in eastern Hokkaido, such as Kushiro, is relatively small.

When traveling to Hokkaido in winter, let's first be aware of "which region" to visit. In addition, snow measures for transportation such as airports and trains are fully prepared, but please check the snow information just in case.

## Estimated annual snowfall in Hokkaido
